Download Android Apk From Google play (without sign in to Google) To Computer

This is something that happens in all operating systems, but perhaps we wish it were not so. It is likely that you have bought an Android device, you have gone to download WhatsApp, to give an example of one of the most popular applications, and you have realized that you cannot unless you create or enter an account. Do you want to download the apps without using a Google account? Keep reading. What is described in this little tutorial is not going to explain anything dangerous. That is, we all know that there are third-party application stores that do not have as much security (if they have it) as the Google Play Store, the official Android application store. The good thing about this trick is that we will download the applications from the official store, which will allow us to install an APK that, in theory, has already been reviewed by Google itself and thus you can enjoy the apps of Google Play free that we publish every day. Below you have explained the steps to follow. Steps to follow to download apps from Google Play without an account. Example we will use for this tutorial it will be the messaging application WhatsApp. I know there are better ones, but WhatsApp is one of the most popular free applications on any platform, so it seems to me that it is not a bad option. We open any web browser that allows us to download files. We go to the Google Play Store and look for the application that we want to install. It is likely that from a smartphone or tablet what we are looking for does not appear, so a good idea would be to search for the application by searching Google. In the WhatsApp example, I have searched for "whatsapp google play". Once we access the application installation page, we look at the URL bar and copy what is behind the equal symbol (=). In the case of WhatsApp, what we have to copy is «com.whatsapp & hl=es». Now we go to the APK Downloader web page, available from THIS LINK. In the dialog box, we paste what we have copied in step 3. Next, we touch on «Generate download link». The next step is to click on the green button, where it says «Click here to download CODE_DE_LA_APP now», where «CODE_DE_LA_APP» will be the ID of the application that we want to install. The download will begin. Once the download is finished, we look for the downloaded file. Its location will depend on the browser that we have used to download the APK of the application. In the case of Firefox, the downloads are in the options button (three dots) / Tools. We run the APK to begin the installation. Finally, we follow the process as when we install any other application. Is this system safe? Totally safe. As we have explained previously, the method to install applications from Google Play without an account carries the name of the official Android application store. The APKs downloaded using this system are obtained directly from Google Play, so we could say that installing them with this system is neither more nor less secure than doing it from the official application store. Of course, in the steps included in this tutorial I have not mentioned something that may be important: it is that it is necessary that we allow the installation of unknown sources to be able to install the downloaded APKs. If we always have it allowed, we will not see any warning, but if we do not have it, it will tell us that it may have been modified to add malicious code. But I repeat once more, Applications downloaded with this method are exactly as safe as those downloaded from the official store of Android. What do we gain by using this method? Well, everything will depend. More and more users are concerned about our privacy. I know people who don't like working for "GAFIA" (Google, Apple, Facebook and Amazon) and they prefer not to tell these companies what, how and when they use something. On the one hand, using this method makes it a bit more difficult for Google to know which applications we use on our iOS device. I know they are not in the majority, but they can be understood. On the other hand, this method is also indicated for people who do not use Google services. Why create an account if all these users want is to download applications? Perhaps downloading apps from Google Play without an account is not as simple as doing it from an official application store, but I would not create it for myself just for this reason. Was this tutorial helpful? Over the past few years, I made a big change to the way I use my phone. I decided to use Android without Google. Can I use Android without a Google account? As it turns out, giving up and saying no to Google is possible, and the experience isn't nearly as bad as you might think. This is to look at what I'm still able to do on Android without relying on any of Google's services, including Google Play Services, and what I have had to give up. Why Use Android Without Google? Only a particular set of people are willing to give up access to the Play Store and Google's suite of apps. That said, you may be one of them. Perhaps you want to remove Google from your life entirely. There are many reasons why you might want to use a Google-free Android phone; here are some of the big ones. 1. Google Has Gotten Out of Hand When I first started using Google, it was to perform searches. Then it became a way to manage mail, which then turned into a place for instant messaging. Later, Google became a way to look at maps, which morphed into a GPS replacement steering me around town. Still further, it became a place for writing documents and storing files. Google became a way to browse the web and sync every page I visited. Then it turned into a way to download and manage apps, track Android devices, and wipe them remotely. Search on Android became Google Now, which then became Google Assistant, a digital assistant that uses everything Google knows about us based on our activity. I'm not inherently against sharing any of this information with a company, but to share it all with one company is a bit much. This leads us to the next reason. 2. You Want to Increase Your Privacy Google Play Services runs in the background on every Android device that ships with the Play Store. This helps Google perform a number of tasks, from installing apps remotely to pulling up your location. These services also give third-party apps access to some of that functionality. Opting to use Android without signing into a Google account reduces some of the information you're giving away. That said, it won't suddenly turn your device into a ghost. The act of pinging and connecting to cell towers makes mobile phones inherently trackable. But making this change reduces some of the information that you generate and share. 3. You Like Open Source Android is an open source operating system, but most of the software that we use on our phones isn't. If you've ever wanted to use only the open source bits, the easiest way is to replace your phone's default firmware with a custom ROM. This way, you know you're getting the parts Google contributes to the Android Open Source Project. Sure, there are some proprietary bits that get your phone's radios and sensors to work, but that's the same compromise many of us make when we install Linux on our PCs. Since it's really hard to know which apps in the Play Store are open source, avoiding it entirely decreases your likelihood of installing something closed-source. You will still need to get apps from somewhere, but we'll come back to that. Why Shouldn't You Go Google-Free? You're curious about using a non-Google-Android phone; here are some reasons why you might want to exercise restraint. 1. You May Have to Give Up a Lot of Apps You might not be able to continue using much of what you rely on right now. Saying goodbye to Google means losing out on the many Android apps that Google makes. If you choose to go a step further, and use only open source software, like I did, this is even more drastic. Say goodbye to social networks, music streaming services, popular games, most navigation tools, cloud storage providers, video streaming sites, and many productivity tools. There are alternatives to some of these apps available, but if you want to go 100% open source, you're going to miss out on quite a bit. Alternative app stores may provide access to a good number of apps you would find on Google Play, but updates don't roll out as quickly. Some of these sources fall weeks or months behind. This isn't solely a matter of losing out on the latest features either. 3. Security Risks Slow updates can leave you open to known vulnerabilities. But that's not the primary security risk you open yourself up to. The most common way to compromise a device is to install malicious software, typically unsuspectingly. Using an alternative app store means allowing your device to install software outside of the Play Store, opening yourself up to these kinds of attacks. Unfortunately, this is a trade-off you have to consider for yourself. Do you rely on the added security that comes from only installing software from the Play Store? Or do you get your apps from elsewhere and run the risk of getting your hands on something that hasn't been vetted? What Apps Can You Use Out of the Box? Even without installing a single app, our smartphones are already capable of doing a great deal. You can place calls, send text messages, take photos, maintain a calendar, listen to music, solve math problems, take notes, and browse the web without looking for additional software. This is already more than what feature phones can do, and let's be real, millions of people are still carrying one of those around without it having a negative effect on their lives. You can turn your Android phone into an advanced dumbphone and stop there. How functional your phone will be out of the box depends on the manufacturer. Samsung devices come with a number of pre-installed apps you'll only find on each company's devices. These apps will continue to work without syncing your phone to a Google account. On a Pixel device, the situation is a bit more challenging, since these phones come loaded with Google software. Even if you remove all the apps that require a Google account to function, you will still lose some features in the apps that remain. For example, the dialer app still works fine, but it doesn't automatically pull down contacts, and you can only pull up numbers that are saved to your device. The camera app take photos, but it doesn't offer to automatically back them up to Google Photos. YouTube Music only plays files stored locally. Frankly, this situation didn't bother me. Despite the wide availability of music streaming services, I still buy albums and store my music locally. Even with access to cloud services, I back up much of my data to hard drives. When given the choice to sync my browsing history and tabs, I decline. These are all habits I formed due to limited data plans, spotty coverage, inconsistent access to a reliable internet connection, and discomfort at the thought of trusting companies with such personal data. I say this to stress that there may be other benefits you lose by giving up Google that just didn't occur to me, due to the way I use my phone. That said, I needed more apps than this to continue doing what I expected from a smartphone. How Do You Get More Apps Without Google? There are a number of alternative app stores for Android, but I'm only going to go over a couple. Which one you prefer will vary depending on why you're choosing to use Android without a Google account. F-Droid I didn't just opt to use a smartphone without Google. I also wanted to exclusively use open source software. Because of this, I chose to install F-Droid, an app store of sorts that only contains free and open source software. Linux users may find that it feels more like a software repository. The service keeps logs of new apps and lets you revert to older releases if necessary. F-Droid contains over a thousand apps, and I find I can get by using just its selection. That said, I don't play many games on my phone, nor do I use it to browse social networks. Folks who do won't find what they're looking for here. Download: F-Droid (Free) Amazon Appstore The Amazon Appstore has been around since 2011 and now contains over 300,000 apps. If you don't trust Google but still want your software distributed by another well-known name, Amazon may be the way to go. This is the default app store on Amazon Fire tablets, and its collection is large enough to keep folks who buy those devices satisfied. The Appstore lacks access to Google software, but you shouldn't have much trouble finding alternatives. You will also find apps from the major social networks. But for the privacy-conscious, I don't see how trading Google for Amazon is at all an improvement. Download: Amazon Appstore (Free) Other Google Play Alternatives In addition to F-Droid and the Amazon Appstore, there are a few other Google Play alternatives. You might also consider checking the Aurora Store, an open source Play Store client that can be used anonymously, or Samsung's app store if you own one of their devices. Download: Aurora Store (Free) Download: Samsung Store (Free) Download: Wikipedia (Free) Google Maps may work without an account, but I had already cut down on my usage even before giving up the Play Store. Instead I tried options like Sygic and Nokia Here. These apps are still available in places outside of the Play Store. Since I decided to go the open source route, I eventually settled on OsmAnd. It's not nearly as flashy as other navigation apps, but with the option to download free maps of most of the world, it does have its advantages. I recommend pairing OSMAnd with an address-locating app like Acastus, because the app is pretty bad at recognizing street addresses on its own. Download: OsmAnd (Free) Download: Acastus Photon (Free) Podcasts Podcasts are a major form of entertainment for me. My previous favorite podcast app was BeyondPod, but now I've started using AntennaPod. There are only a couple other options available in F-Droid, but if you aren't working with that limitation, you shouldn't have any problem at all finding a good podcast app in your alternative app store of choice. Download: AntennaPod (Free) Notes and To-Do Lists I really like Google Keep, but I'm not a fan of the way it syncs everything to the cloud. This means I'm also put off by Evernote and similar alternatives. I prefer apps that only store my notes locally. Fortunately, there are quite a few options: Download: Mirakel (Free) Download: Notepad (Free) Download: Tasks (Free) Really, That's All You Needed? Pretty much. My device came with a decent music player, and so does the OS that ships on most phones. If you need a recommendation, try Shuttle, which is available on the Amazon Appstore, or Spotify as well. On the social network front, there's Facebook, Pinterest, Instagram, and Twitter. Amazon's store is absolutely loaded with games, too. Living Without Google Play Services Not signing into a Google account cuts the company off from your personal identity, but it doesn't disconnect Google from your device. To really go Google-free, you must get rid of Google Play services. However, you can't do so without a decent amount of effort. This is not one of those apps you can disable out of the box. There are two choices you can make. The least invasive option is to root your phone, which will let you delete software you can't otherwise remove. The second is to replace your phone's default OS with a custom ROM. I went with the latter approach. Even after you do this, some apps require Google Play Services to run. This means doing without some excellent third-party apps like Pushbullet. Unfortunately, the apps that need Google Play Services aren't clearly marked. As it turned out, my solution was to exclusively use software I could find in F-Droid. Despite this, you can presumably get by with whatever you find on Amazon or in alternative markets where Google apps aren't available. You'll be fine unless you start hunting around for APKs on the web. What if I Just Use Google Play Services? If you're interested in cutting out Google, it's probably because you don't want to give the company so much information. Well, take a moment to go to the Google Play services Play Store page and view the list of required permissions. You may not have done this before, since the background service comes pre-installed on most devices and generally only draws attention to itself when it crashes. Anyway, notice how you're granting access to just about everything. This is no shameful secret or anything. You can visit the Google Developers site to see how Google Play services are intended to integrate with Android and Android apps. Most of those permissions are likely in place to enable this integration. Nevertheless, that's a lot of permission you're giving to a single app that connects to remote servers, typically without notice. But I Can't Do Without Google! Okay, you don't have to cut yourself off entirely. You still have the option to sign into Google sites in your mobile browser the same way you would from a PC. The experience won't be quite as good as using native apps, but if you're concerned about privacy, this option lets you browse in incognito mode or clear cookies manually whenever you wish. If you decide to use a custom ROM, you also have the option of installing microG, an open source reimplement of Google Play services. It will let you run apps that depend on

Play services, it doesn't track your data, and will let you disable parts of the API. Is Using Android Without Google Worth It? We have surrendered a great deal of personal information to smartphone makers, but this is hardly a story unique to Android, or even iOS for that matter. We've accepted this trade-off with every social network, free email provider, online maps site, and seemingly every other internet-driven service. There are many ways to cope with this new reality, but as we see at the beginning of every EULA agreement, you either accept this or you opt out. I'm not out to encourage everyone to give up Google. The company has done some good. Even without the Play Store, Android as a whole is predominantly a Google project. But Android devices (and Chromebooks too) are based on Linux, which gives an open source guy like myself the freedom to make these sort of adjustments. Going Google-free gives privacy-minded users the option to take a bit more control over their devices. It gives minimalists the ability to strip out whatever isn't necessary to place calls and browse the web. Doing this also gives us all the capability to opt out without having to throw away our phones. No Google? For me, no problem.
